Using Applied Films, Paints, Etc.

To ensure the longevity and safety of your insulated glass products, avoid applying after-market films or paint. Applying these materials can alter the glass's thermal and solar performance, creating a temperature imbalance that may lead to Insulated glass failure. This risk is heightened with Low-E coatings.

Additionally, aftermarket films and paints lack standardized testing for glass compatibility, and issues like adhesive inconsistency and paint off-gassing can cause permanent visual defects such as residue deposits that are visually apparent and objectionable over time. Please note that applying these materials voids the manufacturer's warranty. As a result, A3 Glass Fabricator does not provide warranty coverage for IGUs altered with films or paints.

In summary, A3 Glass Fabricator does not provide warranty coverage for any Insulated Glass Unit that has been altered with films or paints.
